

#Day 3 – Git Commands

git init - Creates a new Git repository in the current folder.

git clone - Copies an existing remote repository to your local machine.

git status - Shows the current state of your repository.

git add - Adds files to the staging area.

git commit - Saves staged changes as a snapshot in Git history.

git log - Displays commit history.

git diff - Shows differences between file versions.

git branch - Lists, creates, or deletes branches.

git branch -a - Shows all local and remote branches.

git checkout - Switches to another branch.

git switch - Modern alternative to git checkout for branch switching.

git remote - Shows configured remote repositories.

git fetch - Downloads changes from the remote repository but does not merge them.

git fetch --all -> Fetches updates from all remotes.

git pull - Fetches and merges remote changes into the current branch.

git push - Uploads local commits to a remote repository.

git merge - Combines changes from one branch into another.

git rebase - Moves your branch commits on top of another branch.

git stash - Temporarily saves uncommitted changes.

git reset - Moves the branch pointer to a previous commit.

git revert - Creates a new commit that undoes a previous commit.

git tag - Creates version markers (releases).

git clean - Removes untracked files.

git fork - A fork is a copy of someone else's repository created under your own GitHub account.
