

#Day 2 - JWT - Authentication

JWT stands for JSON Web Token

Encryption - Converting data into binary form

Decryption - Converting binary data back into its original form.

Token is stored in hash mapping.

Hashing - It is used for mainly for storing password in the database.

JWT - authentication :-

Having some algorithm token used for authentication and authorization between a client and a server.

To use in java we use:-

jwtService

jwtUtil

jwtTokenProvider

JWT Utility Class

```
public class JwtUtil {  
    // Create JWT Token  
    public String generateToken(String username) {  
        ...  
    }  
    // Read username from token  
    public String extractUsername(String token) {  
        ...  
    }  
}
```

```
// Check whether token is valid  
public boolean validateToken(String token) {  
    ...  
}  
}  
  
String token = jwtUtil.generateToken("rahul@gmail.com");
```

Payload - It is the input in the backend.
