

#Day 5 - Soft Development Life Cycle(SDLC)

Phases of SDLC:

Requirement Analysis – Gather and analyze business requirements.

System/Functional Design – Design the system architecture and functionality.

Development/Implementation – Write and build the application code.

Testing – Verify that the software works as expected and identify defects.

Deployment – Release the software to users or production environments.

Maintenance – Fix bugs, provide updates, and enhance features after deployment.

Functional Specification Document (FSD) – Describes the functional requirements and behavior of the system.

Unit testing – Testing individual components or modules of the application.

Types of SERVER:

Development (DEV) – Used by developers for coding and initial testing.

Quality Assurance (QA) – Used by testers to validate application functionality.

Production (PROD) – Live environment used by end users.

SDLC Models

Waterfall Model – A sequential model where each phase is completed before moving to the next.

Agile Model – An iterative and flexible model that delivers software in small increments (sprints).
